1.1. For random variables X and Y, show that:
 $Var[Y] = E[Var(Y|X)] + Var[E(Y|X)]$ **Solu-
tion:**

Let the abbreviations LE and LIE denote linearity of expectations and law of iterated expectations respectively.

$$Var[Y] = E[Y^2] - [E(Y)]^2 \text{ (definition)} \quad (1.1.1)$$

$$= E[E(Y^2|X)] - (E[E(Y|X)])^2 \text{ (LIE)} \quad (1.1.2)$$

$$= E[E(Y^2|X)] - (E[E(Y|X)])^2 - E([E(Y|X)]^2) + E([E(Y|X)]^2) \quad (1.1.3)$$

$$= E[E(Y^2|X)] - E([E(Y|X)]^2) + E([E(Y|X)]^2) - (E[E(Y|X)])^2 \text{ (LE \& LIE)} \quad (1.1.4)$$

$$= Var[E(Y|X)] + E[Var(Y|X)] \text{ (definition)} \quad (1.1.5)$$

Hence, proved.

1.2. Let X be a Random Variable with $E[X] = 3$, $E[X^2] = 13$. Use Chebyshev's Inequality to obtain $\Pr(-2 < X < 8)$

Solution: Let X be a random variable with finite expected value $E[X]$ and finite non-zero variance σ^2 . Then for any real number $k > 0$,

$$\Pr(|X - E[X]| \geq k\sigma) \leq \frac{1}{k^2} \quad (1)$$

computing the variance,

$$\sigma^2 = E[X^2] - E[X]^2$$

$$\implies \sigma^2 = 13 - 9 = 4 \quad (2)$$

$$\sigma = 2 \quad (3)$$

*The author is with the Department of Electrical Engineering, Indian Institute of Technology, Hyderabad 502285 India e-mail: gadepall@iith.ac.in. All content in this manual is released under GNU GPL. Free and open source.

using (3),

$$\Pr(-2 < X < 8) = 1 - \Pr(|X - 3| > 5) \quad (4)$$

$$\Pr(|X - 3| > 5) = \Pr(|X - E[X]| > k\sigma) \quad (5)$$

$$k\sigma = 5$$

$$\implies 2k = 5$$

$$\therefore k = \frac{5}{2} \quad (6)$$

Using (1) , (5) and (6) in (4),

$$\begin{aligned} \Pr(-2 < X < 8) &\geq 1 - \left(\frac{2}{5}\right)^2 \\ \implies \Pr(-2 < X < 8) &\geq \frac{21}{25} \end{aligned} \quad (7)$$

- 1.3. Three points are chosen on the line of unit length. Find the probability that each the 3 line segments have length greater than $\frac{1}{4}$.

Solution:

Let $X, Y \in \{0, 1\}$ be the random variables which represent the position of two points on the line of unit length.

Conditions which should be satisfied to have three line segments with length greater than $\frac{1}{4}$

Event	Condition
A	$\frac{1}{4} < X < \frac{3}{4}$
B	$\frac{1}{4} < Y < \frac{3}{4}$
C	$\frac{1}{4} < X - Y$
D	$\frac{1}{4} < Y - X$

TABLE 1.3.1: Events and their conditions

are given in the below table.

Then the required event which solves the prob-

lem is $ABC + ABD$.

$$\Pr(ABC) = \Pr\left(\frac{1}{4} + Y < X, \frac{1}{4} < X, Y < \frac{3}{4}\right) \quad (1.3.1)$$

$$\begin{aligned} &= \sum \Pr\left(Y = y \mid \frac{1}{4} < X, Y < \frac{3}{4}\right) \times \\ &\quad \Pr\left(\frac{1}{4} + y < X, \frac{1}{4} < X < \frac{3}{4}\right) \end{aligned} \quad (1.3.2)$$

$$\begin{aligned} &= \int_{\frac{1}{4}}^{\frac{3}{4}} dy f_Y(y) \times \\ &\quad \Pr\left(\frac{1}{4} + y < X, \frac{1}{4} < X < \frac{3}{4}\right) \end{aligned} \quad (1.3.3)$$

$$= \int_{\frac{1}{4}}^{\frac{3}{4}} dy f_Y(y) \Pr\left(\frac{1}{4} + y < X < \frac{3}{4}\right) \quad (1.3.4)$$

As X is distributed uniformly between 0 and 1.

$$\Pr\left(\frac{1}{4} + y < X < \frac{3}{4}\right) = \begin{cases} \frac{1}{2} - y & y \in \left(0, \frac{1}{2}\right) \\ 0 & \text{otherwise} \end{cases} \quad (1.3.5)$$

Using (1.3.5),(1.3.4) can be written as

$$\Pr(ABC) = \int_{\frac{1}{4}}^{\frac{1}{2}} dy f_Y(y) \left(\frac{1}{2} - y\right) \quad (1.3.6)$$

As y is distributed uniformly between 0 and 1.

$$\Pr(ABC) = \int_{\frac{1}{4}}^{\frac{1}{2}} \frac{1}{2} - y \, dy \quad (1.3.7)$$

$$= \frac{1}{32} \quad (1.3.8)$$

Similarly, we can find,

$$\Pr(ABD) = \frac{1}{32} \quad (1.3.9)$$

As C and D are mutually exclusive events.

$$\Pr(ABC + ABD) = \Pr(ABC) + \Pr(ABD) \quad (1.3.10)$$

$$= \frac{1}{16} \quad (1.3.11)$$

\therefore probability that each of the three line seg-

ments have length greater than $\frac{1}{4}$ is $\frac{1}{16}$.

- 1.4. Two points are chosen on a line of unit length. Find the probability that each of the 3 line segments will have length greater than $\frac{1}{4}$?

Solution: let us choose points X, Y on a line, since we are picking points randomly they have a uniform distribution in (0, 1).

let us take two random variables X, Y. This points divide in into segments X, Y - X, 1 - X
From question

$$X > \frac{1}{4} \quad (1.4.1)$$

$$Y - X > \frac{1}{4} \quad (1.4.2)$$

$$1 - X < 1/4 \quad (1.4.3)$$

$\binom{2}{1} \times \Pr\left(X + \frac{1}{4} < Y < \frac{3}{4}, \frac{1}{4} < X < \frac{1}{2}\right)$ is the required answer since given random variables X, Y are interchangeable.

$$\Pr\left(X + \frac{1}{4} < Y < \frac{3}{4}, \frac{1}{4} < X < \frac{1}{2}\right) \quad (1.4.4)$$

$$= \int_{X=\frac{1}{4}}^{X=\frac{1}{2}} \int_{Y=X+\frac{1}{4}}^{Y=\frac{3}{4}} dY dX \quad (1.4.5)$$

$$= \int_{X=\frac{1}{4}}^{X=\frac{1}{2}} \left(\frac{1}{2} - X\right) dX \quad (1.4.6)$$

$$= \left(\frac{X}{2} - X^2\right) \Big|_{\frac{1}{4}}^{\frac{1}{2}} \quad (1.4.7)$$

$$= \frac{1}{8} - \frac{1}{8} + \frac{1}{32} \quad (1.4.8)$$

$$= \frac{1}{32} \quad (1.4.9)$$

So, req answer is

$$2 \times \Pr\left(X + \frac{1}{4} < Y < \frac{3}{4}, \frac{1}{4} < X < \frac{1}{2}\right) = \frac{1}{16}$$

Ans is $\frac{1}{16}$

- 2.1. Let the random variable X have the distribution $P(X = 0) = P(X = 3) = p$, $P(X = 1) = 1 - 3p$ for $0 \leq p \leq \frac{1}{2}$. What is the maximum value of $V(X)$?

- A) 3
B) 4
C) 5
D) 6

E) none

Solution: Given, for $0 \leq p \leq \frac{1}{2}$,

$$P(X = 0) = p \quad (2.1.1)$$

$$P(X = 1) = 1 - 3p \quad (2.1.2)$$

$$P(X = 3) = p \quad (2.1.3)$$

Now consider $P(X = 1) = 1 - 3p$ for $p = \frac{1}{2}$.
We get,

$$P(X = 1) = 1 - 3p \quad (2.1.4)$$

$$= 1 - (3) \left(\frac{1}{2}\right) \quad (2.1.5)$$

$$= 1 - \frac{3}{2} \quad (2.1.6)$$

$$= -\frac{1}{2} < 0 \quad (2.1.7)$$

Probability cannot be negative. But in equation (0.0.7) probability is negative, which is not possible.

Therefore, the question is not a proper one.

Answer : Option E

- 2.2. X_1 and X_2 are independent Poisson variables such that $\Pr(X_1 = 2) = \Pr(X_1 = 1)$ and $\Pr(X_2 = 2) = \Pr(X_2 = 3)$. What is the variance of $(X_1 - 2X_2)$?

a) 14

b) 4

c) 3

d) 2

Solution: For a Poisson variable X,

$$\Pr(X = k) = \frac{\lambda^k e^{-\lambda}}{k!} \quad (2.2.1)$$

Since $\Pr(X_1 = 2) = \Pr(X_1 = 1)$,

$$\frac{\lambda_1^2 e^{-\lambda_1}}{2!} = \frac{\lambda_1^1 e^{-\lambda_1}}{1!} \quad (2.2.2)$$

$$\lambda_1 = 2!/1! = 2 \quad (2.2.3)$$

Similarly, as $\Pr(X_2 = 2) = \Pr(X_2 = 3)$,

$$\frac{\lambda_2^2 e^{-\lambda_2}}{2!} = \frac{\lambda_2^3 e^{-\lambda_2}}{3!} \quad (2.2.4)$$

$$\lambda_2 = 3!/2! = 3 \quad (2.2.5)$$

Also we know for a Poisson variable X, the

following holds true:

$$E[X] = \lambda \quad (2.2.6)$$

$$\text{Var}[X] = \lambda \quad (2.2.7)$$

$$\text{Var}[X] = E[X^2] - (E[X])^2 \quad (2.2.8)$$

Now, for the variance of $(X_1 - 2X_2)$

$$\begin{aligned} \text{Var}[X_1 - 2X_2] &= E[(X_1 - 2X_2)^2] - (E[X_1 - 2X_2])^2 \\ &= E[X_1^2 + 4X_2^2 - 4X_1X_2] \\ &\quad - (E[X_1] - 2E[X_2])^2 \\ &= E[X_1^2] - (E[X_1])^2 + 4E[X_2^2] \\ &\quad - 4(E[X_2])^2 + 4E[X_1X_2] \\ &\quad + 4E[X_1]E[X_2] \end{aligned} \quad (2.2.9)$$

Since the variables are independent:

$$E[X_1X_2] = E[X_1]E[X_2] \quad (2.2.10)$$

Substituting equations (2.2.7) and (2.2.8), we get:

$$\begin{aligned} \text{Var}[X_1 - 2X_2] &= \text{Var}[X_1] + 4(\text{Var}[X_2]) \\ &\quad - 4E[X_1][X_2] + 4E[X_1][X_2] \\ &= \lambda_1 + 4\lambda_2 = 2 + 4(3) = 14 \end{aligned} \quad (2.2.11)$$

Hence option (a) 14 is correct.
